

Clock

2.20

Features

- Quickly defines new clocks
- Refers to system or design-wide clocks
- Configures the clock frequency tolerance

General Description

The Clock Component provides two key features: it allows you to create local clocks, and it allows you to connect to system and design-wide clocks. All clocks are shown in the PSoC Creator Design-Wide Resources (DWR) Clock Editor. For more information, refer to the Clock Editor section of the PSoC Creator Help.

Clocks may be defined in several ways, for example:

- As a frequency with an automatically selected source clock
- As a frequency with a user-selected source clock
- As a divider and user-selected source clock

If a frequency is specified, PSoC Creator automatically selects a divider that yields the most accurate resulting frequency. If allowed, PSoC Creator also examines all system and design-wide clocks and selects a source and divider pair that yields the most accurate resulting frequency.

Appearance

The color of the Clock Component waveform symbol will change based on the clock's domain (as shown in the DWR Clock Editor), as follows:

- Digital – The waveform color is the same as a digital wire, with a black outline.
- Analog – The waveform color is the same as an analog wire, with a black outline.
- Indeterminate – The waveform color is white, with no outline.

Input/Output Connections

This section describes the various input and output connections for the Clock. An asterisk (*) in the list of I/Os indicates that the I/O may be hidden on the symbol under the conditions listed in the description of that I/O.

clock – output

Clocks have a standard output terminal that provides access to the clock signal.

Clock_1 
12 MHz

digital domain – output *

If **Force clock to be Analog Clock** is selected, this optional output provides access to the digital domain output from an analog clock. Enable this output using the option on the **Advanced** tab of the **Configure** dialog.

Clock_1 
12 MHz

Component Parameters

Drag a Clock onto your design and double-click it to open the **Configure** dialog.

Note For any local clock you add to your design, the DWR Clock Editor contains a "Start on Reset" option, which is enabled by default. In some cases, such as to reduce power consumption, you may wish to control the clock programmatically. In such cases, deselect the "Start on Reset" option, and insert the Clock_Start() function in your code. See the [Application Programming Interface](#) section of this datasheet and the Clock Editor section of the PSoC Creator Help, for more details.

Basic Tab

The **Basic** tab contains the **Clock Type** and **Source** parameters. Based on your selections, this tab will contain various other parameters as shown in the following figures:

Figure 1. Clock Type: New / Source: <Auto>

The screenshot shows the 'Configure 'Clock_1'' dialog box with the 'Basic' tab selected. The 'Name' field is 'Clock_1'. The 'Clock type' is set to 'New' (radio button selected). The 'Source' is set to '<Auto>'. Under 'Specify', the 'Frequency' is 12 MHz. The 'Tolerance' is set to -5% to +5% (checkbox checked). The 'Use fractional divider' checkbox is unchecked. A 'Summary' section at the bottom indicates 'API Generated: Yes' and 'Uses Clock Tree Resource: Yes'. A note states: 'By default, all clocks are marked as 'start on reset'. The setting can be changed in the Design Wide Resources editor.' At the bottom are buttons for 'Datasheet', 'OK', 'Apply', and 'Cancel'.

Figure 2. Clock Type: New / Source: Specific Clock

Configure 'Clock_1'

Name: Clock_1

Basic Built-in

Clock type: ☒ New ☐ Existing

Source: HFCIk (24 MHz)

Specify: ☒ Frequency: 12 MHz ☐ Divider: ☐ Use fractional divider

Summary
API Generated: Yes
Uses Clock Tree Resource: Yes

Source Clock Info
Name: HFCIk
Enabled: Yes
Frequency: 24 MHz
Accuracy: ±2
Divider: 1

By default, all clocks are marked as 'start on reset'. The setting can be changed in the Design Wide Resources editor.

Datasheet OK Apply Cancel

Figure 3. Clock Type: New (on devices with Phase Align Clock feature)

Configure 'Clock_1'

Name: Clock_1

Basic Built-in

Clock type: ☒ New ☐ Existing

Source: <Auto>

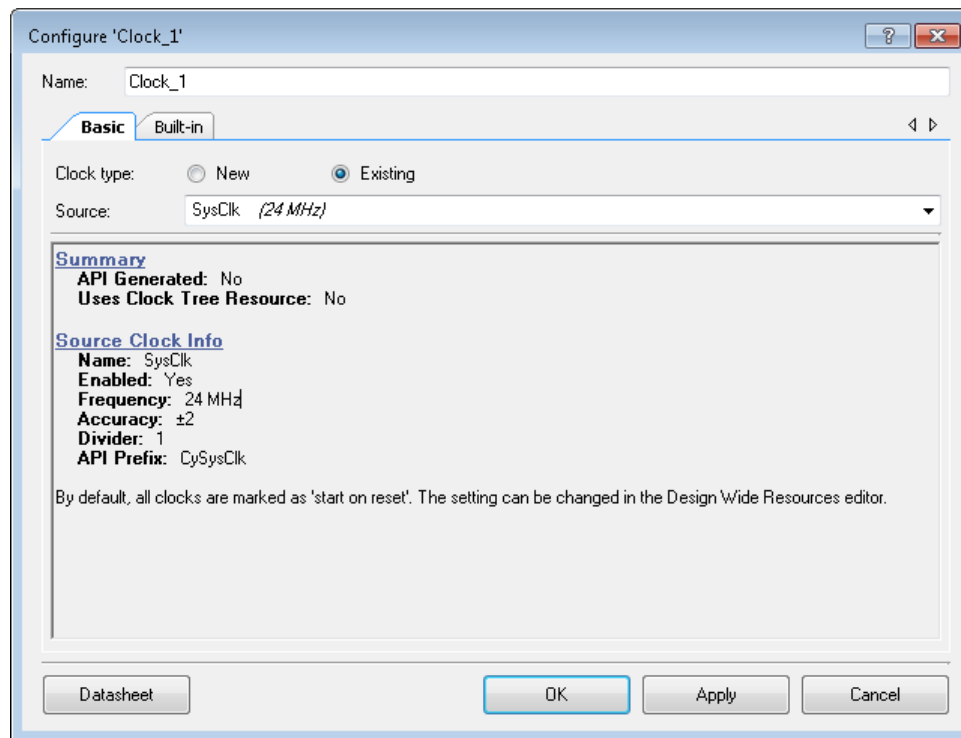

Initially align to: HFCIk (24 MHz)

Specify: Frequency: 12 MHz ☒ Tolerance: - 5% + 5% ☐ Use fractional divider

Summary
API Generated: Yes
Uses Clock Tree Resource: Yes

By default, all clocks are marked as 'start on reset'. The setting can be changed in the Design Wide Resources editor.

Datasheet OK Apply Cancel

Figure 4. Clock Type: Existing

The following sections describe the Clock Component parameters:

Clock Type

There are two clock types: **New** and **Existing**. For new clocks, you can specify a clock **Source** to use or allow PSoC Creator to choose by selecting **<Auto>**. If you select **<Auto>**, you can also enter a specific **Frequency** and optional **Tolerance**. If you specify a **Source**, you can either specify a **Frequency** or choose a **Divider**. For existing clocks, you can only select the clock **Source**.

For different configurations, the clock symbol displays differently on the schematic, as shown in the following examples.

New/Desired Frequency	New/Divider	Existing
Clock_1  12 MHz	Clock_2  ILO / 1	BUS_CLK 

Clock Components configured as **New** consume clock resources in the device and have APIs generated for them. Clock Components configured as **Existing** to a system or design-wide clock do not consume any physical resources on the device and no APIs are generated for them. Instead, they use the selected system or design-wide clock.

Source

Select **<Auto>** (default) if you want PSoC Creator to automatically locate an available source clock that, when divided down, provides the most accurate resulting frequency. Clocks with a source of **<Auto>** may only enter a desired frequency. A tolerance may also optionally be provided.

Select a system or design-wide clock from the list provided to force PSoC Creator to use that clock as the source.

Initially align to

On devices with the Phase Align Clock feature, this parameter allows you to specify the design-wide clock that this clock will align to when started. By default, all clocks start aligned to HFCLK, but it can be useful to specify other alignment relationships. For example, a 6 MHz clock and a 3 MHz clock will initially align to HFCLK (shown at 24 MHz) by default. This has the potential to produce waveforms that are out of phase, as shown below.

By specifying the 3 MHz clock to initially align to the 6 MHz design-wide clock, you can ensure that these clocks start in phase, as shown below.

Note This parameter has no effect if the clock is not set to "Start on Reset" in the DWR Clock Editor. In such a scenario, it is necessary to align the clock using the [StartEx\(\)](#) API.

Frequency

Enter the desired frequency and units (default = **12 MHz**). PSoC Creator then calculates the divider that will create a clock signal that is as close as possible to the desired frequency.

On PSoC 4100 / PSoC 4200, if the **Source** is specified as **<Auto>** and the desired frequency results in a divider value larger than 65536, PSoC Creator will automatically chain two 16-bit dividers in order to achieve the closest possible divider that is a product of two 16-bit numbers. In this case, the SetDivider and SetFractionalDivider APIs are not available. To be able to dynamically modify the divider of a chained-divider clock, you must specify the chaining explicitly with a Design-Wide Clock: Add a Design-Wide Clock from the Clock Editor in the DWR and specify the **Source** of the clock Component to be the Design-Wide Clock you just created.

Configure the **Divider** values of those two clocks such that their product achieves the intended divider value.

Tolerance

If you select **<Auto>** as the clock source, you can enter the desired tolerance values for the clock (default is $\pm 5\%$). PSoC Creator will ensure that the accuracy of the resulting clock falls within the given tolerance range or produce a warning if the desired clock is not achievable. Clock tolerances are specified as a percentage. (**Note** Entering ppm will cause the value entered to be converted to the corresponding percent value.) If there is no desired tolerance range, then deselect the check box next to the tolerance and no warning will be generated for this clock.

Divider

If you choose a specific **Source**, you can enter an explicit value for the **Divider**. Otherwise, if you leave the **Source** set to **<Auto>**, the **Divider** option is not available (default).

If you select the **Divider** option, then the **Frequency** option is not available.

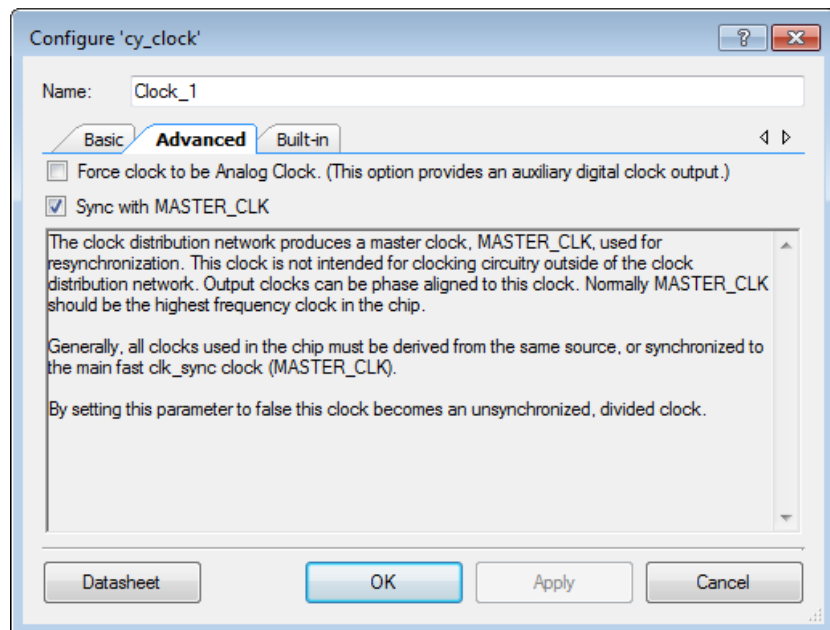

On PSoC 4, you can select **Use fractional divider** to allow fractional values to be used for the divider value. If you have specified a frequency, the clock solver will use the fractional divider to try to obtain the requested frequency. If you have specified a divider, you will be able to enter a fractional divide value between 0 and 31.

The clock divider value is the sum of the integer divider value and the fractional divider value. For example, if the integer divider is set to 10 and the fractional divider value is set to 16, then the clock divider value is 10 added with $16/32$, or 10.5.

Advanced Tab

The **Advanced** tab contains two parameters.

Note The Advanced tab does not exist for PSoC 4 devices.

Force clock to be Analog Clock

If checked (default = unchecked), this option adds a terminal for the version of the analog clock that uses the main digital sync clock as the resync clock. If used, this clock is forced into the analog domain; however, the newly added terminal is in the digital domain.

Sync with MASTER_CLK

If selected (default = not selected) the clock is synchronized with the MASTER clock; otherwise, the clock is unsynchronized.

Application Programming Interface

Application Programming Interface (API) routines allow you to configure the Component using software. The following table lists and describes the interface to each function. The subsequent sections cover each function in more detail.

By default, PSoC Creator assigns the instance name “Clock_1” to the first instance of a Component in a given design. You can rename it to any unique value that follows the syntactic rules for identifiers. The instance name becomes the prefix of every global function name, variable, and constant symbol. For readability, the instance name used in the following table is “Clock.”

Note Local clocks configured with **Clock Type** set to **Existing** on the **Configure** dialog will not have any APIs generated.

Function	Description
Clock_Start()	Enables the clock.
Clock_StartEx()	Starts the clock initially phase aligned to the specified clock.
Clock_Stop()	Disables the clock.
Clock_StopBlock() ^[1]	Disables the clock and waits until the clock is disabled.
Clock_StandbyPower() ^[1]	Selects the power for standby (Alternate Active) operation mode.
Clock_SetDivider()	Sets the divider of the clock and restarts the clock divider immediately.
Clock_SetDividerRegister() ^[2]	Sets the divider of the clock and optionally restarts the clock divider immediately.
Clock_SetDividerValue()	Sets the divider of the clock and restarts the clock divider immediately.
Clock_GetDividerRegister()	Gets the clock divider register value.
Clock_SetMode() ^[1]	Sets flags that control the operating mode of the clock.
Clock_SetModeRegister() ^[1]	Sets flags that control the operating mode of the clock.
Clock_GetModeRegister() ^[1]	Gets the clock mode register value.
Clock_ClearModeRegister() ^[1]	Clears flags that control the operating mode of the clock.
Clock_SetSource() ^[1]	Sets the source of the clock.
Clock_SetSourceRegister() ^[1]	Sets the source of the clock.
Clock_GetSourceRegister() ^[1]	Gets the source of the clock.
Clock_SetPhase() ^[1]	Sets the phase delay of the analog clock (only generated for analog clocks).

¹ Not applicable to PSoC 4 devices.

² Parameter “reset” is not supported for PSoC 4 devices.

Function	Description
Clock_SetPhaseRegister() ^[1]	Sets the phase delay of the analog clock (only generated for analog clocks).
Clock_SetPhaseValue() ^[1]	Sets the phase delay of the analog clock (only generated for analog clocks).
Clock_GetPhaseRegister() ^[1]	Gets the phase delay of the analog clock (only generated for analog clocks).
Clock_SetFractionalDividerRegister() ^[3]	Sets the fractional divider of the clock and restarts the clock divider immediately.
Clock_GetFractionalDividerRegister() ^[3]	Gets the fractional clock divider register value.

void Clock_Start(void)

Description: Starts the clock.

Note On startup, clocks may already be running if the “Start on Reset” option is enabled in the DWR Clock Editor.

Parameters: void

Return Value: void

Side Effects: The clock is enabled.

void Clock_StartEx(uint32 alignClkDiv)

Description: Starts the clock, phase aligned to the specified clock divider. This API requires the target phase align clock to be already running. Therefore the correct procedure is to start the target align clock and then call this API to align to that target clock.

If the target phase align clock is stopped and restarted, then phase alignment will be lost and the API should be called again to realign.

Note This API is only available on PSoC 4 devices with the Phase Align clock feature. On startup, clocks may already be running if the “Start on Reset” option is enabled in the DWR Clock Editor.

Parameters: uint32 alignClkDiv: the DIV_ID of the intended phase alignment clock. For example if Clock is intended to be aligned to Clock_1, then this function will pass Clock_1_DIV_ID.

Return Value: void

Side Effects: None

³ Only applicable to PSoC 4 devices.

void Clock_Stop(void)

Description: Stops the clock and returns immediately. This API does not require the source clock to be running but may return before the hardware is actually disabled. If the settings of the clock are changed after calling this function, the clock may glitch when it is started. To avoid the clock glitch, use the Clock_StopBlock() function.

Parameters: void

Return Value: void

Side Effects: The clock is disabled. The output will be logic 0.

void Clock_StopBlock(void)

Description: Stops the clock and waits for the hardware to actually be disabled before returning. This ensures that the clock is never truncated (high part of the cycle will terminate before the clock is disabled and the API returns). Note that the source clock must be running or this API will never return as a stopped clock cannot be disabled.

Parameters: void

Return Value: void

Side Effects: The clock is disabled. The output will be logic 0.

Note The Clock_StopBlock() API is only supported on PSoC 3 and PSoC 5LP, and will not be generated for other devices.

void Clock_StandbyPower(uint8 state)

Description: Selects the power for standby (Alternate Active) operation mode.

Note: The Clock_Start API enables the clock in Alternate Active Mode, and the Clock_Stop and ClockStopBlock APIs disable the clock in Alternate Active Mode.

If the clock is enabled, but needs to be disabled in Alternate Active Mode, Clock_StandbyPower(0) should be called after Clock_Start(). If the clock is disabled, but needs to be enabled in Alternate Active mode, Clock_StandbyPower(1) should be called after Clock_Stop().

Parameters: uint8 state: 0 to disable clock during Alternate Active mode, nonzero to enable.

Return Value: void

Side Effects: None

void Clock_SetDivider(uint16 clkDivider)

- Description:** Modifies the clock divider, and thus, the frequency. When the clock divider register is set to zero or changed from zero, the clock is temporarily disabled in order to change a mode bit. If the clock is enabled when Clock_SetDivider() is called, the source clock must be running. The current clock cycle will be truncated and the new divide value will take effect immediately.
- The difference between this and Clock_SetDividerValue is that this API must consider the +1 factor.
- Parameters:** uint16 clkDivider: Divider register value (0 to 65,535). This value is NOT the divider; the clock hardware divides by clkDivider plus one. For example, to divide the clock by 2, this parameter should be set to 1.
- Return Value:** void
- Side Effects:** None

void Clock_SetDividerRegister(uint16 clkDivider, uint8 reset)

- Description:** Modifies the clock divider, and thus, the frequency. When the clock divider register is set to zero or changed from zero, the clock is temporarily disabled in order to change a mode bit. If the clock is enabled when Clock_SetDivider() is called, then the source clock must be running.
- Parameters:** uint16 clkDivider: Divider register value (0 to 65,535). This value is NOT the divider; the clock hardware divides by clkDivider plus one. For example, to divide the clock by 2, this parameter should be set to 1.
- uint8 reset: If nonzero, restarts the clock divider; the current clock cycle will be truncated and the new divide value will take effect immediately. If zero, the new divide value will take effect at the end of the current clock cycle.
- Return Value:** void
- Side Effects:** None

void Clock_SetDividerValue(uint16 clkDivider)

- Description:** Modifies the clock divider, and thus, the frequency. When the clock divider register is set to zero or changed from zero, the clock will be temporarily disabled in order to change the SSS mode bit. If the clock is enabled when Clock_SetDivider() is called, then the source clock must be running. The current clock cycle will be truncated and the new divide value will take effect immediately.
- Parameters:** uint16 clkDivider: Divide value (1 to 65535) or zero. If clkDivider is zero, the clock will be divided by 65,536.
- The difference between this and Clock_SetDivider() is that this API does not have to consider the +1 factor.
- Return Value:** void
- Side Effects:** None

uint16 Clock_GetDividerRegister(void)

Description: Gets the clock divider register value.

Parameters: void

Return Value: Divide value of the clock minus 1. For example, if the clock is set to divide by 2, the return value is 1.

Side Effects: None

void Clock_SetMode(uint8 clkMode)

Description: Sets flags that control the operating mode of the clock. This function only changes flags from 0 to 1; flags that are already 1 remain unchanged. To clear flags, use the Clock_ClearModeRegister() function. The clock must be disabled before changing the mode. This API provides the same functionality as the SetModeRegister API.

Parameters: uint8 clkMode: Bit mask containing the bits to set. For PSoC 3, clkMode should be a set of the following optional bits ORed together:

- CYCLK_EARLY: Enable early phase mode. Rising edge of output clock will occur when the divider counter reaches half of the divide value.
- CYCLK_DUTY: Enable 50-percent duty cycle output. When enabled, the output clock is asserted for approximately half of its period. When disabled, the output clock is asserted for one period of the source clock.
- CYCLK_SYNC: Enable output synchronization to master clock. This should be enabled for all synchronous clocks.

See the Technical Reference Manual for details about setting the mode of the clock. Specifically, see the CLKDIST.DCFG.CFG2 register.

Return Value: void

Side Effects: None

void Clock_SetModeRegister(uint8 clkMode)

Description: Same as Clock_SetMode(). Sets flags that control the operating mode of the clock. This function only changes flags from 0 to 1; flags that are already 1 will remain unchanged. To clear flags, use the Clock_ClearModeRegister() function. The clock must be disabled before changing the mode.

This API provides the same functionality as the SetMode API.

Parameters: uint8 clkMode: Bit mask containing the bits to set. It should be a set of the following optional bits ORed together:

- CYCLK_EARLY: Enable early phase mode. Rising edge of output clock will occur when the divider counter reaches half of the divide value.
- CYCLK_DUTY: Enable 50-percent duty cycle output. When enabled, the output clock is asserted for approximately half of its period. When disabled, the output clock is asserted for one period of the source clock.
- CYCLK_SYNC: Enable output synchronization to master clock. This should be enabled for all synchronous clocks.

See the Technical Reference Manual for details about setting the mode of the clock. Specifically, see the CLKDIST.DCFG.CFG2 register.

Return Value: void

Side Effects: None

uint8 Clock_GetModeRegister(void)

Description: Gets the clock mode register value.

Parameters: void

Return Value: Bit mask representing the enabled mode bits. See the Clock_SetModeRegister() and Clock_ClearModeRegister() descriptions for details about the mode bits..

Side Effects: None

void Clock_ClearModeRegister(uint8 clkMode)

Description: Clears flags that control the operating mode of the clock. This function only changes flags from 1 to 0; flags that are already 0 will remain unchanged. The clock must be disabled before changing the mode.

Parameters: uint8 clkMode: Bit mask containing the bits to clear. It should be a set of the following optional bits ORed together:

- CYCLK_EARLY: Enable early phase mode. Rising edge of output clock will occur when the divider counter reaches half of the divide value.
- CYCLK_DUTY: Enable 50-percent duty cycle output. When enabled, the output clock is asserted for approximately half of its period. When disabled, the output clock is asserted for one period of the source clock.
- CYCLK_SYNC: Enable output synchronization to master clock. This should be enabled for all synchronous clocks.

See the Technical Reference Manual for details about setting the mode of the clock. Specifically, see the CLKDIST.DCFG.CFG2 register.

Return Value: void

Side Effects: None

void Clock_SetSource(uint8 clkSource)

Description: Sets the input source of the clock. The clock must be disabled before changing the source. The old and new clock sources must be running.

This API provides the same functionality as the SetSourceRegister API.

Parameters: uint8 clkSource: Should be one of the following input sources:

- CYCLK_SRC_SEL_SYNC_DIG: Phase-delayed master clock
- CYCLK_SRC_SEL_IMO: Internal main oscillator
- CYCLK_SRC_SEL_XTALM: 4- to 33-MHz external crystal oscillator
- CYCLK_SRC_SEL_ILO: Internal low-speed oscillator
- CYCLK_SRC_SEL_PLL: Phase-locked loop output
- CYCLK_SRC_SEL_XTALK: 32.768-kHz external crystal oscillator
- CYCLK_SRC_SEL_DSI_G: DSI global input signal
- CYCLK_SRC_SEL_DSI_D: DSI digital input signal
- CYCLK_SRC_SEL_DSI_A: DSI analog input signal

See the Technical Reference Manual for details on clock sources.

Return Value: void

Side Effects: None

void Clock_SetSourceRegister(uint8 clkSource)

Description: Same as Clock_SetSource(). Sets the input source of the clock. The clock must be disabled before changing the source. The old and new clock sources must be running.

This API provides the same functionality as the SetSource API.

Parameters: uint8 clkSource: It should be one of the following input sources:

- CYCLK_SRC_SEL_SYNC_DIG: Phase-delayed master clock
- CYCLK_SRC_SEL_IMO: Internal main oscillator
- CYCLK_SRC_SEL_XTALM: 4- to 33-MHz external crystal oscillator
- CYCLK_SRC_SEL_ILO: Internal low-speed oscillator
- CYCLK_SRC_SEL_PLL: Phase-locked loop output
- CYCLK_SRC_SEL_XTALK: 32.768-kHz external crystal oscillator
- CYCLK_SRC_SEL_DSI_G: DSI global input signal
- CYCLK_SRC_SEL_DSI_D/CYCLK_SRC_SEL_DSI_A: DSI input signal (Both constants map to the same value).

See the Technical Reference Manual for details on clock sources.

Return Value: void

Side Effects: None

uint8 Clock_GetSourceRegister(void)

Description: Gets the input source of the clock.

Parameters: void

Return Value: The input source of the clock. See Clock_SetSourceRegister() for details.

Side Effects: None

void Clock_SetPhase(uint8 clkPhase)

Description: Sets the phase delay of the analog clock. This function is only available for analog clocks. The clock must be disabled before changing the phase delay to avoid glitches.

This API provides the same functionality as the SetPhaseRegister API.

Parameters: uint8 clkPhase: Amount to delay the phase of the clock, in 1.0-ns increments. clkPhase must be from 1 to 11 inclusive. Other values, including 0, disable the clock.

clkPhase value	Phase delay
0	Clock disabled
1	0.0 ns
2	1.0 ns
3	2.0 ns
4	3.0 ns
5	4.0 ns
6	5.0 ns
7	6.0 ns
8	7.0 ns
9	8.0 ns
10	9.0 ns
11	10.0 ns
12 to 15	Clock disabled

Return Value: void

Side Effects: None

void Clock_SetPhaseRegister(uint8 clkPhase)

Description: Same as Clock_SetPhase(). Sets the phase delay of the analog clock. This function is only available for analog clocks. The clock must be disabled before changing the phase delay to avoid glitches.

This API provides the same functionality as the SetPhase API.

Parameters: uint8 clkPhase: Amount to delay the phase of the clock, in 1.0-ns increments. clkPhase must be from 1 to 11 inclusive. Other values, including 0, disable the clock.

clkPhase value	Phase delay
0	Clock disabled
1	0.0 ns
2	1.0 ns
3	2.0 ns
4	3.0 ns
5	4.0 ns
6	5.0 ns
7	6.0 ns
8	7.0 ns
9	8.0 ns
10	9.0 ns
11	10.0 ns
12 to 15	Clock disabled

Return Value: void

Side Effects: None

void Clock_SetPhaseValue(uint8 clkPhase)

Description: Sets the phase delay of the analog clock. This function is only available for analog clocks. The clock must be disabled before changing the phase delay to avoid glitches. Same as Clock_SetPhase(), except Clock_SetPhaseValue() adds one to the value and then calls Clock_SetPhaseRegister() with it.

Parameters: uint8 clkPhase: Amount to delay the phase of the clock, in 1.0-ns increments. clkPhase must be from 0 to 10 inclusive. Other values disable the clock.

clkPhase value	Phase delay
0	0.0 ns
1	1.0 ns
2	2.0 ns
3	3.0 ns
4	4.0 ns
5	5.0 ns
6	6.0 ns
7	7.0 ns
8	8.0 ns
9	9.0 ns
10	10.0 ns
11 to 15	Clock disabled

Return Value: void

Side Effects: None

uint8 Clock_GetPhaseRegister(void)

Description: Gets the phase delay of the analog clock. This function is only available for analog clocks.

Parameters: void

Return Value: Phase of the analog clock in nanoseconds. See Clock_SetPhaseRegister() for details.

Side Effects: None

void Clock_SetFractionalDividerRegister(uint16 clkDivider, uint8 fracDivider)

Description: Modifies the clock divider and the fractional clock divider. The fractional divider requires that the integer divider be at least 1 (that is, divide by 2).

Parameters: uint16 clkDivider: Integer divider register value (0 to 65,535). This value is NOT the divider; the clock hardware divides by clkDivider plus one. For example, to divide the clock by 2, this parameter should be set to 1.

uint8 fracDivider: Fractional divider register value (0 to 31). This value represents fractional clock divide values in increments of 1/32. For example, if clkDivider is set to 1 and fracDivider value is set to 4, then the clock divider value is $2 + 4/32$, or 2.125.

Return Value: void

Side Effects: None

uint8 Clock_GetFractionalDividerRegister (void)

Description: Gets the fractional clock divider register value.

Parameters: Void

Return Value: Fractional divide value of the clock. If the fractional clock divider is not in use, the return value is 0.

Side Effects: None

MISRA Compliance

This section describes the MISRA-C:2004 compliance and deviations for the Component. There are two types of deviations defined:

- project deviations – deviations that are applicable for all PSoC Creator Components
- specific deviations – deviations that are applicable only for this Component

This section provides information on Component-specific deviations. Project deviations are described in the MISRA Compliance section of the *System Reference Guide* along with information on the MISRA compliance verification environment.

The Clock Component does not have any specific deviations.

Sample Firmware Source Code

PSoC Creator provides numerous example projects that include schematics and example code in the Find Example Project dialog. For Component-specific examples, open the dialog from the Component Catalog or an instance of the Component in a schematic. For general examples, open the dialog from the Start Page or **File** menu. As needed, use the **Filter Options** in the dialog to narrow the list of projects available to select.

Refer to the “Find Example Project” topic in the PSoC Creator Help for more information.

Resources

Resource use varies based on configuration and connectivity.

- Clock Components configured as **Existing** do not consume any resource on the chip.
- Clock Components configured as **New** consume a single clock resource. PSoC Creator automatically discovers whether the clock connects to digital or analog peripherals and consumes a digital clock or analog clock resource as necessary.

API Memory Usage

The Component memory usage varies significantly, depending on the compiler, device, number of APIs used and Component configuration. The following table provides the memory usage for all APIs available in the given Component configuration.

The measurements have been done with the associated compiler configured in Release mode with optimization set for Size. For a specific design, the map file generated by the compiler can be analyzed to determine the memory usage.

Configuration	PSoC 3 (Keil_PK51)		PSoC 4 (GCC)		PSoC 5LP (GCC)	
	Flash Bytes	SRAM Bytes	Flash Bytes	SRAM Bytes	Flash Bytes	SRAM Bytes
Digital clock	574	0	104	0	416	0
Analog clock	589	0	104	0	448	0

Component Changes

This section lists the major changes in the Component from the previous version.

Version	Description of Changes	Reason for Changes / Impact
2.20.c	Updated the datasheet.	Specified that the clock chaining feature is only supported in PSoC 4100 / PSoC 4200.
		Added clarifying remarks regarding fractional divider behavior.
2.20.b	Minor datasheet edits.	
2.20.a	Added more description to StartEx().	Description was not complete.
2.20	Added “Initially align to” parameter in customizer. Added StartEx() API.	Support for PSoC 4 clocks with the Phase Align Clock feature.
2.10	Minor visual updates to symbol	Provide up to date source-clock information on the symbol for “Existing” type Clock Components.
2.0.a	Added PSoC 4 support	Modified GUI and APIs to function correctly with PSoC 4
	Added Clock_SetFractionalDividerRegister() and Clock_GetFractionalDividerRegister() APIs	Allows the firmware to set/get the current fractional divider value
2.0	Added MISRA Compliance section.	The Component does not have any specific deviations.
	Updated Clock_Start, Clock_Stop, and Clock_StopBlock APIs	The APIs now start/stop the clock in both Active and Alternate Active modes. This is consistent with other PSoC Creator Components. See the Clock_Standby API description for more details.
1.70	Added PSoC 5LP support	
	Minor datasheet edits and updates	
1.60	Updated Clock_SetDivider() and Clock_SetDividerRegister() APIs	Fixed APIs to function correctly with PSoC 5
	Changed wording of the “digital domain – output”	
	Added note to Clock_Stop() in datasheet	
1.50.a	Added note to Clock_StopBlock() in datasheet to note lack of silicon support	
	Minor datasheet edits and updates	
1.50	Added Clock_StopBlock() API	This function stops the clock and waits for it to be disabled. This is necessary to prevent glitches when changing settings and restarting a clock.
	Added Clock_GetPhaseRegister() API (analog only)	Allows the firmware to read the current phase value.

Version	Description of Changes	Reason for Changes / Impact
	Added Clock_SetPhaseValue() API (analog only)	This macro wraps Clock_SetPhaseRegister() and automatically adds 1 to the phase value to provide a more intuitive interface.
	Renamed Clock_SetPhase() to Clock_SetPhaseRegister() (analog only)	For consistency with other names. For compatibility, SetPhase is provided as a macro and has the same effect as Clock_SetPhaseRegister().
	Added Clock_GetSourceRegister() API	Allows the firmware to read the current clock source.
	Renamed Clock_SetSource() to Clock_SetSourceRegister()	For consistency with other names. For compatibility, SetSource is provided as a macro and has the same effect as Clock_SetSourceRegister().
	Added Clock_GetModeRegister() API	Allows the firmware to read the current mode flags.
	Added Clock_SetModeRegister() API	This function replaces Clock_SetMode(). For compatibility, SetMode is provided as a macro and has the same effect as Clock_SetModeRegister(). Clock_SetModeRegister() only changes mode flags from 0 to 1. This prevents unintended clearing of other mode bits such as SYNC.
	Added Clock_ClearModeRegister() API	This function is similar to Clock_SetModeRegister(), but only changes mode flags from 1 to 0.
	Added Clock_GetDividerRegister() API	Allows the firmware to read the current divider value.
	Added Clock_SetDividerRegister() API	The Clock_SetDivider() API unconditionally resets the clock divider. Clock_SetDividerRegister() allows the firmware author to control whether the divider is reset.
	Added Clock_SetDividerValue() API	This macro wraps Clock_SetDividerRegister() and automatically subtracts 1 from the divider to provide a more intuitive interface.
	Set SSS in Clock_SetDividerRegister()	When dividing by 1 (divide value of 0), the SSS bit must be set to bypass the divider. The Clock_SetDividerRegister() function will automatically set/clear SSS, temporarily disabling the clock if necessary.
	Changed register definitions	Updated to match Component coding guidelines.
	Corrected Clock_SetDivider() API documentation	The Clock_SetDivider() API documentation stated that the clkDivider parameter should be the divide value + 1. This should have been the divide value - 1. The documentation incorrectly stated that 0 was an invalid value for clkDivider.
	Changed “Synch with Bus” to “Sync with Master” and associated tooltip on the Configure dialog.	Updated to match how the device works. This was just a cosmetic change.
	Added parameter to enable the digital domain output from the analog clock.	A signal is available from analog clocks in the hardware that was not previously exposed on the Component.

Version	Description of Changes	Reason for Changes / Impact
	Added `=ReentrantKeil(\$INSTANCE_NAME . "_...")` to the following functions: void Clock_Start() void Clock_Stop() void Clock_StopBlock() void Clock_StandbyPower() void Clock_SetDividerRegister() uint16 Clock_GetDividerRegister() void Clock_SetModeRegister() void Clock_ClearModeRegister() uint8 Clock_GetModeRegister() void Clock_SetSourceRegister() uint8 Clock_GetSourceRegister() void Clock_SetPhaseRegister() uint8 Clock_GetPhaseRegister()	Allows users to make these APIs reentrant if reentrancy is desired.
1.0.a	Move CYCLK_ constants to <i>cydevice.h/cydevice_trm.h</i> .	The CYCLK_ constants for the mode and source are now generated from the selected device's register map. This allows the clock Component to be independent of device-specific register values. The <i>cydevice.h</i> file is already included from the clock header, so no user code changes should be necessary.
	Add description of CYCLK_ constants in the datasheet.	The parameter descriptions for the Clock_SetMode() and Clock_SetSource() APIs now contain a description of each value.
